

Chapter 10 - Price management

Price management

Description

It is possible to retrieve the customer prices for a given product, simply by passing parameters to a web service query.

These custom prices are available for the following entities:

- products
- combinations

Custom prices have an alias that you must indicate.

Example

Let's say we want to retrieve the price for combination '25' of the product '1', without tax, in a web service field name "my_price".

The query: `/api/products/1?price[my_price][use_tax]=0&price[mon_prix][product_attribute]=25`

Parameters

Here is the list of available parameters when needing to define a custom price:

- country
- state
- currency
- group
- quantity
- decimals
- product_attribute
- use_tax
- use_reduction
- use_ecotax
- only_reduction
